
A: Linux: The file in question is a "softlink" to the binary executable file /usr/bin/pmdg_md11_fsx_ed. This is a Linux link. On Linux the softlink is a "symbolic link" where the "real" file is not specified in the link, instead it is the path of the link (the directory where the executable is). Windows: The file is a "hardlink" (or just "link", i don't remember exactly how it is called in Windows). This is a Windows link. On Windows the link points to the directory where the original file is. If you don't specify the location of the file (if you only have the link), it looks for the original file in the same directory as the link. A more complete answer: It appears that you have the file PMDG MD11 FTX Cracked by Komu 24 on the system. That file is a Binary executable (read: program). The binary file is stored in the directory /opt/programs/. The name of the program might be different, you only see the binary executable file. You can check by typing "file" in Linux or "dir" in Windows. As the file is a binary executable, Windows or Linux won't open it (it is likely it is some kind of application) and that is why you can't open the file. You can rename the executable file, so it's another name. You can copy the file into a directory where you have the installed program and then open the copied file. You can also try to extract the file, maybe there are settings that can be changed or.cfg-files that explain the file. Q: Does the Python Egg PYC byte code use more instructions then plain python source? Reading this page it says that egg uses some extra instructions that can be used to speed up the compilation. On a different note, what are the differences in the bytecode of the generated extension modules? A: Yes, compilers tend to use more instructions for language constructs that are more expensive. With dynamic languages like Python, that's sort of to be expected, since all the parsing and execution is done by the runtime, rather than statically. If we expect that it will become more of an optimization concern for f678ea9f9e
